Battery status monitoring

Multy language interface

FUNCTIONS

The ultraFACE was designed to manage the parameters of high-tech equipment, such as ultra freezers.

The display is 100% touch screen and enables full control and monitoring of all components of the ultra freezer.

For example, it allows checking the status of the internal batteries, which provides electrical supply to the display even in case of lack of electricity.

Moreover, it is possible to view and download, via USB, all data concerning activated alarms and machine performances.

Last but not least, the controller has a triple security system that ensures the inviolability of the data and reduces the possibility of unauthorized control by external elements.
